Abstracts

HIV (Human immunodeficiency virus) is a retrovirus which causes HIV infection and attacks the CD-4 cells (T-cells) in the immune system of human body. HIV reduces the number of T-cells in the body and makes the immune system vulnerable to life-threatening infections and cancers. An infected person cannot get rid of this virus properly but its effects can be reduced with the treatment.

HIV does not get spread easily into human. Only certain body fluids of an infected person can transmit HIV into others. HIV never gets transmitted through casual contacts like handshakes, sharing food or water. It has certain transmission ways including blood transmission of an infected person to non-infected person, exchange of body fluids like semen, pre-seminal or vaginal fluids during unprotected physical contacts and from a mother to child during pregnancy or breastfeeding.

HIV therapeutics market is likely to witness a growth with increasing demand for single tablet regimens and growth of HIV diagnostic market is expected to be driven by increasing technological advancements in diagnosis tests.

Middle East and Africa are the major contributors to the global HIV market supported by increased prevalence of HIV due to rising drug abuse and unprotected physical contacts among adolescents. Asia-Pacific is likely to experience further growth of HIV market due to recent development in HIV treatments.

The global HIV market is expected to grow in future due to decreasing HIV related death rates, low awareness of HIV transmission and government initiatives to promote HIV treatment. Key trends of this market include progressing HIV drug under pipeline, increasing adoption of STR and Development of technologically advanced diagnostic

products. However, there are some factors which can hinder growth of the market including decreasing global HIV funds, social stigma and discrimination and treatment failures.
