Abstracts

Pneumonia is a lung infection that causes inflammatory condition in one or both lungs. It affects small air sacs known as alveoli by filling them with fluid or pus, making a person difficult to breathe. It can be classified into community-acquired pneumonia and hospital-acquired pneumonia. Hospital acquired pneumonia can be further classified into healthcare associated pneumonia and ventilator associated pneumonia. A person suffering from pneumonia can experience problems like fever along with chills, cough with pus or phlegm, shortness of breath, pain in chest while breath in or coughing and lower than normal body temperature, rapid heartbeats, ongoing nausea or vomiting and decline in energy levels.

The U.S. is expected to be the first region to start selling pneumonia drugs in pipeline and later on, penetration of pneumonia drugs would occur in Europe. The U.S. and Europe have high prevalence of severe forms of multiple drug resistance (MDR) organism which would result into a high demand for pneumonia drugs in future.

The global pneumonia market is expected to grow in future with growing ageing population, increasing pharmaceutical R&D spending, increasing healthcare expenditure, accelerating economic growth, growing children population and rise in multiple drug resistance (MDR) organisms. Key trends of this market include progressing drug under pipeline, innovation in treatment options and increased preference towards combination therapy. However, there are some factors which can hinder growth of the market including stringent regulations and entry of generic drugs.
