Abstracts

Pulmonary arterial hypertension (PAH) is one form of pulmonary hypertension (PH) condition, which means high blood pressure in the lungs. Many diseases such as obstructive sleep apnea (OSA), lung diseases, diastolic heart failure and diseases of the left heart can cause the pressures in the pulmonary arteries to elevate but is not pulmonary arterial hypertension. PAH is a life threatening disease characterized by an increase in pulmonary vascular resistance that eventually leads to death. It is a rare disease, affects about 15-70 people per million in the U.S. The symptoms of PAH are difficult to diagnose as the symptoms are common to other diseases.

Pulmonary arterial hypertension is a severe condition and there is no cure to PAH at present time. Many treatments are available to improve symptoms, quality of life and to keep the condition under control. There are currently four classes of drugs approved for the treatment of PAH and 13 approved products are available for PAH in the market across these four drug classes.

The United States is the main contributor to the PAH market with the development of new therapies and increasing cases of pulmonary arterial hypertension. The U.S. has great potential in the years ahead with rising awareness about treatment options of PAH.

The global PAH market is expected to grow in the future due to increasing ageing population, rise in healthcare expenditure, growing women population, increase in obese population and high unmet needs. Key trends of this market include increasing number of cardiovascular diseases, rising government support, and consumption of junk food. However, there are some factors which can hinder the growth of the market which includes patent expiration, high cost and lack of awareness.
