## **Abstracts**

The global plasma derived therapy market is anticipated to reach US\$54.35 billion in 2027, growing at a CAGR of 7.20% during the period spanning 2023-2027. The growth in the market has been driven by factors like rising geriatric population, increasing prevalence of genetic disorders, government initiatives, rising demand for albumin, escalating use of plasma proteins in pharmaceuticals, increasing usage of immunoglobulin, surging autoimmune disorders. The market is expected to face certain challenges such as high cost and stringent regulations. To overcome these challenges, the market would witness some key trends like technological advancements, rising demand for health insurance, escalating use of therapeutic protein drugs, and increasing adoption of plasma therapy in neurology.

The global plasma derived therapy market can be segmented as follows: Immunoglobulin, Hemophilia, Specialty, and Albumin. Immunoglobulin held a larger share of the market in 2022. Due to the rising use in primary immunodeficiency and neurological applications, the immunoglobulins market is predicted to grow. For example, Grifols, S.A., a pharmaceutical and chemical company, launched HyperHEP B, a new formulation of immune globulin derived from human plasma for hepatitis B postexposure prophylaxis, in June 2022, propelling the industry forward.

The global plasma derived therapy market by region can be segmented into the following: North America, Europe, Asia Pacific, and LAMEA. North America held a larger share of the market in 2022. Growing use of immunoglobulins in various therapeutic domains, increased plasma collection (and the number of plasma collection

facilities), and rising prevalence of respiratory disorders and alpha-1-antitrypsin deficiency are all driving market expansion (AATD).
