## Abstracts

Acne and Rosacea are the most common dermatological disorders affecting people in the United States. Acne is a chronic skin disorder in which the hair follicles become blocked and/or inflamed, which is most prevalent among teenagers. However, some people may suffer from acne well into their 30s and 40s even. Acne can occur in forms ranging from comedones to cystic lesions, depending upon severity.

Rosacea is a common skin condition that causes redness and visible blood vessels on the nose, cheeks, and forehead. Rosacea can occur to anyone. But it is most commonly affects adults over age 30, particularly women with fair skin. The condition of rosacea is increasingly widespread in the U.S. and affecting approximately 16 million population in the country.

Topical drugs currently dominate both markets in the U.S. Systemic medications such as oral antibiotics, hormonal agents or other drugs are also used for the treatment of acne and rosacea. The ongoing development of new drugs is expected to witness an extraordinary growth rate due to higher efficacy, convenient dosing and fewer side effects.

The increase in emotional burden due to these skin conditions is a key factor driving the growth of the market. Growing awareness regarding rosacea and acne treatment options has significantly driven the market in the U.S. Rising purchasing power and mounting healthcare expenditure has also fuelled the growth of the market in the region. Despite being common skin disorders, advancement in treatment has been limited over the past years exhibiting a great opportunity of growth in the future. The companies are developing new treatment options, in which, most products are in late-stage indicating an optimistic future for the market.
