Abstracts

Hypertrophic cardiomyopathy (HCM) is an inherited genetic disorder in which the heart walls thicken. The thickening can affect the heart's pumping power as it does not relax adequate enough to fill the heart with blood. Mutation in one of the genes causes sarcomeres, a structural unit of muscles, to become disorganized and thicker. Hypertrophic Cardiomyopathy affects around one in 500 people in the US. Fainting, breath shortage, chest pains and occasionally cardiac arrest are the symptoms of HCM.

The market size of Hypertrophic cardiomyopathy is estimated to be around \$1 billion, encouraging 10+ companies to currently participate in development of therapeutic compounds for the Hypertrophic cardiomyopathy.

To assist researchers, investors and business development managers, VPA Research has come up with a comprehensive report on Hypertrophic Cardiomyopathy pipeline. The report provides insights into different therapeutic candidates in preclinical, research, discovery, NDA/IND, pre registration, phase 1, phase 2, and phase 3 trials). Drugs under development directly and through combination with other drugs are also included.

Current status, developmental phase, participating companies and entities, recent developments, orphan drug/ fast track/ other designations, drug class are provided for each Hypertrophic Cardiomyopathy pipeline product. Mechanism of Action and the target area of the pipeline product are also provided. Further, clinical and preclinical trials along with results of the trials are also included in the report.

In addition to complete details of each product, the report provides key trends in Hypertrophic Cardiomyopathy pipeline studies. The products under development are categorized according to their development phase, mechanism and company to provide detailed insights into the type of drugs being developed and the stages of development.
