Abstracts

Liver Cirrhosis is a catastrophic progressive GI disorder that causes irreversible scarring of the liver. Further, as it does not show symptoms in the initial stages of the disease and only presents symptoms as the disease progresses, treatment is complicated.

Over 20 companies and universities are focusing on developing treatment options for Liver Cirrhosis.

To assist investigators and funding and regulatory organizations, VPA Research has come up with a comprehensive report on Liver Cirrhosis pipeline. The report provides insights into different therapeutic candidates in preclinical, research, discovery, NDA/IND, pre registration, phase 1, phase 2, and phase 3 trials). Drugs under development directly and through combination with other drugs are also included.

Current status, developmental phase, participating companies and entities, recent developments, orphan drug/fast track/other designations, drug class are provided for each Liver Cirrhosis pipeline product. Mechanism of Action and the target area of the pipeline product are also provided. Further, clinical and preclinical trials along with results of the trials are also included in the report.

In addition to complete details of each product, the report provides key trends in Liver Cirrhosis pipeline studies. The products under development are categorized according to their development phase, mechanism and company to provide detailed insights into the type of drugs being developed and the stages of development.
