Abstracts

Myocardial ischemia (MI) refers to a heart related condition in which a part of the myocardium lacks adequate supply of oxygen and blood flow. It occurs as a result of blockage in coronary artery, causes chest pain. The primary symptoms include chest pain, angina pectoris, breath shortage, sudden physical exertion and emotional stress. Sustained ischemia can lead to myocardial infarction, leading to heart tissue death.

To assist researchers, investors and business development managers, VPA Research has come up with a comprehensive report on Myocardial Ischemia pipeline. The report provides insights into different therapeutic candidates in preclinical, research, discovery, NDA/IND, pre registration, phase 1, phase 2, and phase 3 trials). Drugs under development directly and through combination with other drugs are also included.

Current status, developmental phase, participating companies and entities, recent developments, orphan drug/ fast track/ other designations, drug class are provided for each Myocardial Ischemia pipeline product. Mechanism of Action and the target area of the pipeline product are also provided. Further, clinical and preclinical trials along with results of the trials are also included in the report.

In addition to complete details of each product, the report provides key trends in Myocardial Ischemia pipeline studies. The products under development are categorized according to their development phase, mechanism and company to provide detailed insights into the type of drugs being developed and the stages of development.
