Abstracts

Primary sclerosing cholangitis (PSC) is a chronic progressive GI disorder that affects the bile volume in the gall bladder. The slowly progressing condition causes inflammation and scarring of bile ducts, which results in improper flow of the digestive liquid.

Around 30 companies and universities are focusing on developing treatment options for Primary sclerosing cholangitis.

To assist investigators and funding and regulatory organizations, VPA Research has come up with a comprehensive report on Primary sclerosing cholangitis pipeline. The report provides insights into different therapeutic candidates in preclinical, research, discovery, NDA/IND, pre registration, phase 1, phase 2, and phase 3 trials). Drugs under development directly and through combination with other drugs are also included.

Current status, developmental phase, participating companies and entities, recent developments, orphan drug/fast track/other designations, drug class are provided for each Primary sclerosing cholangitis pipeline product. Mechanism of Action and the target area of the pipeline product are also provided. Further, clinical and preclinical trials along with results of the trials are also included in the report.

In addition to complete details of each product, the report provides key trends in Primary sclerosing cholangitis pipeline studies. The products under development are categorized according to their development phase, mechanism and company to provide detailed insights into the type of drugs being developed and the stages of development.
