Abstracts

The global Hepatitis C Drugs market size is poised to register 1.76% growth (CAGR) from 2024 to 2030, presenting significant growth prospects for companies operating in the industry. The industry study analyzes the global Hepatitis C Drugs market By Product (NS5A Inhibitor, Fixed-dose Combination, Others), By Therapy (Combination Therapy, Monotherapy), By Disease (Acute Hepatitis C, Chronic Hepatitis C), By Distribution Channel (Hospital Pharmacies, Retail Pharmacies, Online Pharmacies, Others).

The future of hepatitis C drugs is characterized by the development of highly potent, pan-genotypic antiviral agents with improved tolerability, shorter treatment durations, and simplified treatment regimens for patients infected with hepatitis C virus (HCV). Key trends include the introduction of direct-acting antiviral (DAA) therapies targeting multiple HCV proteins, such as NS3/4A protease inhibitors, NS5A inhibitors, and NS5B polymerase inhibitors, to achieve high rates of sustained virological response (SVR) and cure in patients with chronic HCV infection. Additionally, the exploration of fixed-dose combination therapies and once-daily dosing regimens enhances treatment adherence and facilitates access to therapy for diverse patient populations, including those with

comorbidities and liver cirrhosis. Moreover, efforts to reduce the cost of HCV treatment, increase access to generic versions of DAAs, and implement global elimination strategies aim to achieve the World Health Organization's (WHO) goal of eliminating hepatitis C as a public health threat by 2030, addressing the global burden of HCV-related liver disease and mortality..
