Abstracts

Hyperthyroidism is common form of thyroid disorders, results from overactive thyroid functioning and is mostly observed in women, old population and patients with other thyroid issues. Extra secretion of thyroid hormones leads to speed up of metabolism in the body. Accordingly, patients witness symptoms of anxiety, rapid heartbeat, shivering, excessive sweat excretion, weight loss and insomnia.

Auto-immune disorder including Graves' disease is the common cause of the condition. The disease leads the body to produce anti-body termed thyroid-stimulating immunoglobulin (TSI). The TSI results in thyroid to secrete additional thyroid hormones. In addition, lumps on thyroid gland and arrhythmia medications are also observed to cause hyperthyroidism.

Treatment options vary from patient to patient based on the condition including medication to reduce T3 and T4 hormone secretion, radioiodine and surgery.

Hyperthyroidism clinical trials report from VPA Research provides comprehensive analysis and trends in global Hyperthyroidism disease clinical trials. The research work analyzes the evolution of Hyperthyroidism clinical trial trends across countries and regions.

The report focuses on drugs and therapies being evaluated for Hyperthyroidism treatment in active clinical development phases including phase 1, phase 2, phase 3 and phase 4 clinical trials.
