## **Abstracts**

The global Imatinib Drug market size is poised to register 3.9% growth from 2024 to 2032, presenting significant growth prospects for companies operating in the industry. The industry study analyzes the global Imatinib Drug market across By Application (Aggressive Systemic Mastocytosis (ASM), Chronic Eosinophilic Leukemia (CEL), Dermatofibrosarcoma Protuberans (DFSP), Gastrointestinal Stromal Tumors (GIST), Hyper-eosinophilic Syndrome (HES), Myelodysplastic Syndrome (MDS), Myeloproliferative Diseases (MPD), Philadelphia Chromosome-positive Acute, Lymphoblastic Leukemia (Ph+ ALL), Philadelphia Chromosome-positive Chronic Myeloid, Leukemia (Ph+ CML)), By Form (Tablets, Capsules)

The Imatinib Drug Market is evolving with the increasing prevalence of chronic myeloid

leukemia (CML), gastrointestinal stromal tumors (GIST), and other malignancies harboring specific molecular targets, as well as advancements in targeted cancer therapies that inhibit aberrant signaling pathways and tumor growth. Imatinib, a tyrosine kinase inhibitor (TKI), is used to treat CML and GIST by blocking the activity of BCR-ABL fusion protein and KIT proto-oncogene, respectively, leading to apoptosis and tumor regression. The market is driven by the growing adoption of precision medicine approaches, molecular diagnostics, and personalized treatment algorithms that identify patients with actionable mutations and optimize therapy selection and dosing regimens. Further, the emergence of generic imatinib formulations and biosimilar products is driving market accessibility and affordability, expanding treatment options for patients in resource-limited settings. By 2030, the market is expected to witness further growth as stakeholders invest in next-generation TKIs, combination therapies, and predictive biomarkers that enhance treatment efficacy, overcome resistance mechanisms, and improve long-term outcomes for patients with imatinib-sensitive and resistant malignancies.
