The future of immune checkpoint inhibitors (ICIs) is shaped by advancements in immunotherapy, oncology, and biomarker-driven treatment strategies aimed at enhancing cancer immunotherapy efficacy, expanding indications, and overcoming resistance mechanisms. Key trends include the identification of predictive biomarkers, such as programmed death-ligand 1 (PD-L1) expression, tumor mutational burden (TMB), and immune cell infiltrates, which enable patient selection and treatment stratification for optimal response to ICIs. Additionally, the development of combination immunotherapy regimens, such as ICIs with targeted therapies, chemotherapy, or other immunomodulators, offers synergistic effects, overcoming immune evasion mechanisms

and improving response rates in various cancer types. Moreover, efforts to unravel the mechanisms of primary and acquired resistance to ICIs, including tumor immune escape, T-cell exhaustion, and immunosuppressive tumor microenvironment, aim to develop novel therapeutic strategies, such as combination therapies, adaptive immunotherapies, and immune-modulating agents, to enhance durable responses and long-term survival outcomes for cancer patients treated with ICIs..
