Abstracts

The global Monkeypox Vaccine and Treatment market size is poised to register 10.04% growth from 2024 to 2030, presenting significant growth prospects for companies operating in the industry. The industry study analyzes the global Monkeypox Vaccine and Treatment market across By Product (Vaccine, Drugs, Vaccinia Immune Globulin (VIG), By Gender (Male, Female, Others), By Route of Administration (Oral, Injectable), By End-user (Hospitals, Specialty Clinics, Others).

The Monkeypox Vaccine and Treatment market is experiencing significant growth attributed to the increasing incidence of monkeypox outbreaks, the lack of specific treatments or vaccines, and the growing emphasis on pandemic preparedness and biodefense strategies. Monkeypox is a rare zoonotic viral disease caused by the monkeypox virus, belonging to the same family as the variola virus that causes smallpox. Key drivers of market growth include the potential for monkeypox to cause severe illness and mortality, particularly in immunocompromised individuals, and the risk of person-to-person transmission during outbreaks. Additionally, the absence of approved monkeypox vaccines or antiviral therapies has led to heightened interest in the development of preventive vaccines and therapeutic interventions. Moreover, the increasing investment in research and development by government agencies, biopharmaceutical companies, and international organizations is accelerating vaccine

and treatment development efforts. Furthermore, advancements in vaccine technology platforms, such as viral vector-based vaccines, DNA vaccines, and recombinant protein subunit vaccines, hold promise for the development of safe and effective monkeypox vaccines. Continued surveillance, early detection, and coordinated public health responses are essential for controlling monkeypox outbreaks and mitigating public health risks.
