Abstracts

The global Multi-infarct Dementia market size is poised to register 5.67% growth from 2024 to 2030, presenting significant growth prospects for companies operating in the industry. The industry study analyzes the global Multi-infarct Dementia market across By Type (Pharmacological Treatment, Non Pharmacological Treatment), By Application (Academic, Hospitals, Others).

The Multi-infarct Dementia market is witnessing steady growth attributed to the increasing prevalence of vascular dementia, advances in diagnostic imaging techniques, and the growing awareness about the risk factors and consequences of cerebrovascular disease. Multi-infarct dementia, also known as vascular dementia, is a type of dementia caused by multiple small strokes or infarcts in the brain, leading to cognitive decline, memory loss, and impaired executive function. Key drivers of market growth include the aging population, the high prevalence of cardiovascular risk factors such as hypertension, diabetes, hyperlipidemia, and smoking, which predispose individuals to cerebrovascular disease and dementia. Additionally, the development of advanced neuroimaging modalities such as magnetic resonance imaging (MRI), computed tomography (CT), and positron emission tomography (PET) is enabling early detection and diagnosis of vascular lesions and cerebral infarcts in patients with multi-infarct dementia. Moreover, the increasing focus on preventive measures, lifestyle modifications, and pharmacological interventions targeting vascular risk factors is driving demand for diagnostic testing and therapeutic interventions in the market. Furthermore, the development of disease-modifying treatments, cognitive enhancers,

and vascular protective agents for multi-infarct dementia is expected to further drive market growth in the foreseeable future.
